Note: This tutorial assumes that you have completed the previous tutorials: creating a ROS package (/ROS/Tutorials/CreatingPackage).

Please ask about problems and questions regarding this tutorial on answers.ros.org (http://answers.ros.org). Don't forget to include in your question the link to this page, the versions of your OS & ROS, and also add appropriate tags.

Building a ROS Package

Description: This tutorial covers the toolchain to build a package.

Tutorial Level: BEGINNER

Next Tutorial: Understanding ROS Nodes (/ROS/Tutorials/UnderstandingNodes)

catkin	rosbuild

Conteúdo

1. Building Packages

As long as all of the system dependencies of your package are installed, we can now build your new package.

Note: If you installed ROS using `apt` or some other package manager, you should already have all of your dependencies.

Before continuing remember to source your environment setup file if you have not already. On Ubuntu it would be something like this:

```
# source /opt/ros/%YOUR_ROS_DISTRO%/setup.bash
$ source /opt/ros/kinetic/setup.bash             # For Kinetic for instance
```

1.1 Using catkin_make

catkin_make (/catkin/commands/catkin_make) is a command line tool which adds some convenience to the standard catkin workflow. You can imagine that catkin_make (/catkin/commands/catkin_make) combines the calls to `cmake` and `make` in the standard CMake workflow.

Usage:

```
# In a catkin workspace
$ catkin_make [make_targets] [-DCMAKE_VARIABLES=...]
```

For people who are unfamiliar with the standard CMake workflow, it breaks down as follows:

Note: If you run the below commands it will not work, as this is just an example of how CMake generally works.

```
# In a CMake project
$ mkdir build
$ cd build
$ cmake ..
$ make
$ make install  # (optionally)
```

This process is run for each CMake project. In contrast catkin projects can be built together in workspaces. Building zero to many catkin packages in a workspace follows this work flow:

```
# In a catkin workspace
$ catkin_make
$ catkin_make install  # (optionally)
```

The above commands will build any catkin projects found in the `src` folder. This follows the recommendations set by REP128 (http://ros.org/reps/rep-0128.html). If your source code is in a different place, say `my_src` then you would call catkin_make like this:

Note: If you run the below commands it will not work, as the directory `my_src` does not exist.

```
# In a catkin workspace
$ catkin_make --source my_src
$ catkin_make install --source my_src  # (optionally)
```

For more advanced uses of catkin_make (/catkin/commands/catkin_make) see the documentation: catkin/commands/catkin_make (/catkin/commands/catkin_make)

1.2 Building Your Package

If you are using this page to build your own code, please also take a look at the later tutorials (C++) (/ROS/Tutorials/WritingPublisherSubscriber%28c%2B%2B%29)/(Python) (/ROS/Tutorials/WritingPublisherSubscriber%28python%29) since you may need to modify `CMakeLists.txt`.

You should already have a catkin workspace (/catkin/Tutorials/create_a_workspace) and a new catkin package called `beginner_tutorials` from the previous tutorial, Creating a Package (/ROS/Tutorials/CreatingPackage). Go into the catkin workspace if you are not already there and look in the `src` folder:

```
$ cd ~/catkin_ws/
$ ls src
```

```
beginner_tutorials/  CMakeLists.txt@
```

You should see that there is a folder called `beginner_tutorials` which you created with catkin_create_pkg (/catkin/commands/catkin_create_pkg) in the previous tutorial. We can now build that package using catkin_make (/catkin/commands/catkin_make):

```
$ catkin_make
```

You should see a lot of output from `cmake` and then `make`, which should be similar to this:

```
Base path: /home/user/catkin_ws
Source space: /home/user/catkin_ws/src
Build space: /home/user/catkin_ws/build
Devel space: /home/user/catkin_ws/devel
Install space: /home/user/catkin_ws/install
####
#### Running command: "cmake /home/user/catkin_ws/src
-DCATKIN_DEVEL_PREFIX=/home/user/catkin_ws/devel
-DCMAKE_INSTALL_PREFIX=/home/user/catkin_ws/install" in "/home/user/catki
n_ws/build"

####
#### Running command: "make -j4" in "/home/user/catkin_ws/build"
####
```

Note that catkin_make (/catkin/commands/catkin_make) first displays what paths it is using for each of the 'spaces'. The spaces are described in the REP128 (http://ros.org/reps/rep-0128.html) and by documentation about catkin workspaces on the wiki: catkin/workspaces (/catkin/workspaces). The important thing to notice is that because of these default values several folders have been created in your catkin workspace. Take a look with `ls`:

```
$ ls
```

```
build
devel
src
```

The `build` folder is the default location of the build space (/catkin/workspaces#Build_Space) and is where `cmake` and `make` are called to configure and build your packages. The `devel` folder is the default location of the devel space (/catkin/workspaces#Development_.28Devel.29_Space), which is where your executables and libraries go before you install your packages.

Now that you have built your ROS package let's talk more about ROS Nodes (/ROS/Tutorials /UnderstandingNodes).
